

# HASHMAP I

No one changes the world who isn't obsessed.

Billie Jean King

QuoteMaster.org

Good  
Evening

## Today's Agenda

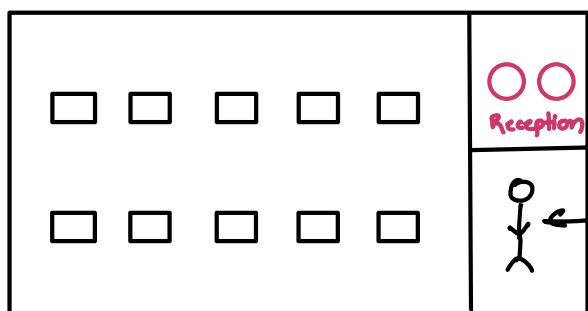

\* Understanding HashMap

- Questions {
- \* Closest Duplicates
  - \* longest chain of consecutive elements
  - \* longest subarray with sum = 0

→ Array of lists

HashMap → DS which stores the info in key-value pair

Hotel (1940)

Unique

103 room no

Room	Avail
1	x
2	✓
3	x
:	
103	✓

Register

Stored some info about the key

Key (Room no) → People , price , Availability , AC

Values

Functionalities in HM

- \* Search for an ele
  - \* Insert an ele
  - \* Remove an ele
  - \* Size of map
  - \* Update an ele
- TC: O(1) avg

\* Store frequency of arr ele

$$A = \{3, 2, 1, 2, 5, 1, 5\}$$

0 1 2 3 4 5 6

$$\text{freqarr} = \begin{array}{|c|c|c|c|c|c|c|} \hline 0 & 2 & 2 & 1 & 0 & 2 \\ \hline 0 & 1 & 2 & 3 & 4 & 5 \\ \hline \end{array}$$

→ Simplest  
hashmap

```
for (int i=0; i<n; i++) {
```

```
    int val = A[i];
```

```
    freqarr[val]++;
```

3

TC:  $O(n)$

SC:  $O(\text{Range of ele})$

$O(\max \text{ of the arr} + 1)$

\* Range of elements =  $[1, 10^9]$

Can we create a freqarr? No

Array size =  $\frac{10^9}{40 \text{ MB}}$  or  $10^7$

Memory limit

Exceeded

Array size =  $10^9 \rightarrow 4 \text{ GB}$  ✗

\* Limited Memory = M

Do we have anything which can limit the range of ele?

## Modulo operator

### Hash Function

Provides us the key within our memory limit

$$h(x) = x \% M$$

↓      ↘  
original      New key which is going to be in our limited memory

$$\text{arr}[] = \{ 10, 20, 30, 27 \} \quad M = 17$$

$$h(x) = x \% 17$$

$$h(10) = 10 \% 17 = 10$$

$$h(20) = 20 \% 17 = 3$$

$$h(30) = 30 \% 17 = 13$$

$$h(27) = 27 \% 17 = 10$$

key	value
10 → 1	
3 → 1	
13 → 1	
10 → 1	

**Collision**

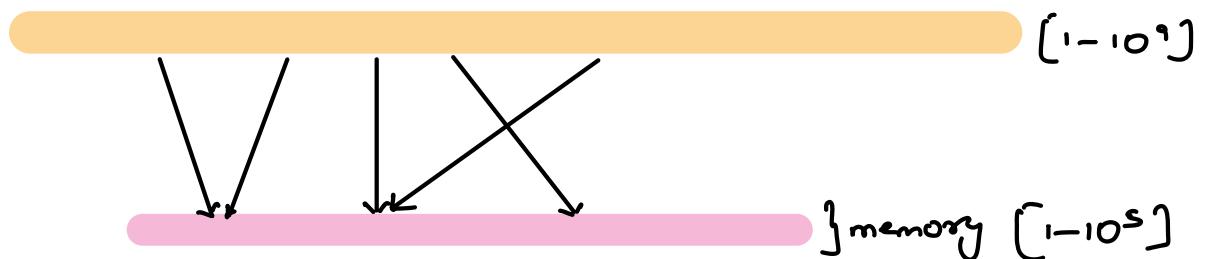

Is it possible to avoid collision? **NO**

(limited memory)

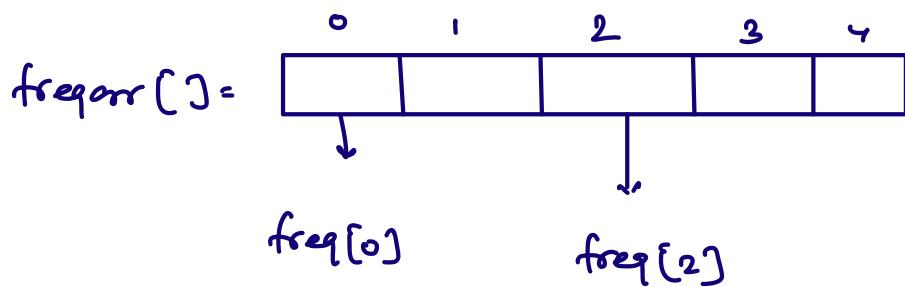

(Pigeon hole principle)

Pigeon hole principle  $\rightarrow$  N holes &  $(N+1)$  pigeons &  
you want to put every pigeon in a hole.

$\rightarrow$  atleast one hole with more than 1 pigeon

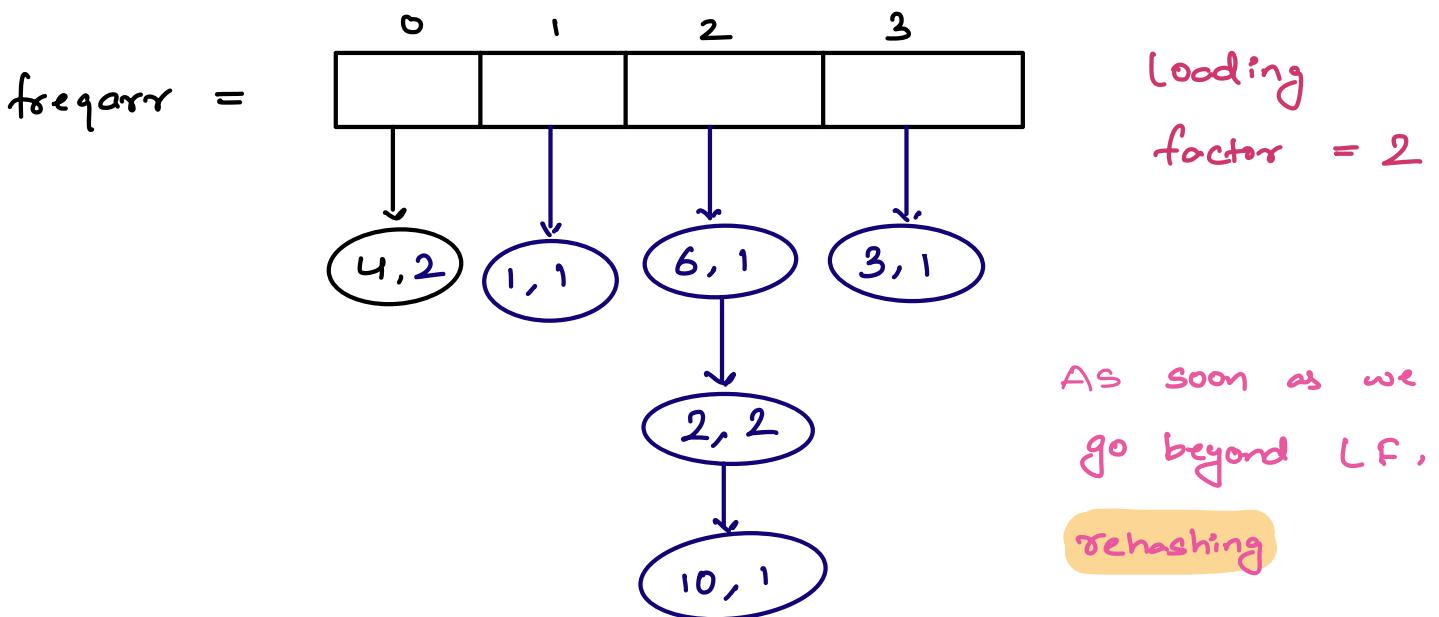

### 03 Handle the collision $\rightarrow$ Chaining

\* Instead of storing the  $\text{freq}[i]$ ,

store a list containing  $A[i], \text{freq}[A[i]]$

$$A = \{ 3 \ 6 \ 4 \ 1 \ 2 \ 10 \ 2 \ 4 \} \quad M=4$$

## Disadvantage of Chaining

\* Searching for an ele e.g. - 3  $\Rightarrow$  TC:  $O(1)$

Worst = TC:  $O(n)$

## \* Hashset

↳ store the keys

Q Check if array contains duplicates or not?

$$A = \{1, 2, 3, 4, 1\}$$

Key - value

HashMap

4 → 1	
1 → 2	X → Contains duplicates
2 → 1	
3 → 1	

Hashset (Unique)

1, 2, 3, 4

`if (hs.size() < n) → duplicate`

## Closest duplicates

Q → Given an integer array of size N. Find pair  $(i, j)$

such that  $j > i$  and  $A[i] == A[j]$  &  $j - i$  is minimum

arr[ ] =	<table border="1"><tr><td>2</td><td>4</td><td>5</td><td>6</td><td>-1</td><td>2</td><td>5</td><td>4</td><td>3</td><td>7</td><td>3</td><td>2</td></tr><tr><td>0</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td><td>11</td></tr></table>	2	4	5	6	-1	2	5	4	3	7	3	2	0	1	2	3	4	5	6	7	8	9	10	11	Ans = 10 - 8 = 2
2	4	5	6	-1	2	5	4	3	7	3	2															
0	1	2	3	4	5	6	7	8	9	10	11															

Brute force → Consider all pairs,

→ find all duplicates pairs, calculate the distance & update the ans accordingly

TC:  $O(n^2)$

SC:  $O(1)$

$$\text{arr[ ]} = \{x \dots x \dots x \dots x\}$$

Conclusion → Should try to store the index of closest equal element.

$$\text{arr[ ]} = \{ \underset{0}{x} \dots \underset{7}{x} \dots \underset{12}{x} \dots \underset{22}{x} \}$$

$$x = \emptyset \neq 12 \quad 22$$

$$\text{ans} = \infty$$

$$\text{ans} = \infty \vee 7 - 0 = 7$$

$$\text{ans} = 7 \text{ vs } 12 - 7 = 5$$

$$\text{ans} = 5 \text{ vs } 22 - 12 = 5$$

arr = [1, 2, 3, 6, 2, 1]  
      0 1 2 3 4 5

## \* HashMap

Key → Distinct ele

Value → indexes

Key      Value

1 → ØS

$$\text{ans} = \infty$$

2 → {4}

$$\text{ans} = \min(\infty \text{ vs } 4 - 1) = 3$$

3 → {2}

$$\text{ans} = \min(3 \text{ vs } 5 - 0) = 3$$

6 → {3}

HM<I, I> map = new HM<>();

int ans =  $\infty$

for (i=0; i<n; i++) {

    int ele = A[i];

    if (map.containsKey(ele) == false) {

        map.put(ele, i);

```
else {
```

```
    int lo = map.get(ele)
```

TC: O(n)

```
    ans = min(ans, i - lo);
```

SC: O(n)

```
    map.put(ele, i);
```

}

3

```
return ans;
```

10:16 pm → 10:26 pm

Q2. Given an array of size N. Find the length of  
longest sequence of consecutive elements.

Eg:- {100 4 3 6 10 20 11 5 101}

Sequence = 100, 101 → 2  
3, 4, 5, 6 → 4  
10, 11 → 2  
20 → 1

Ans = 4

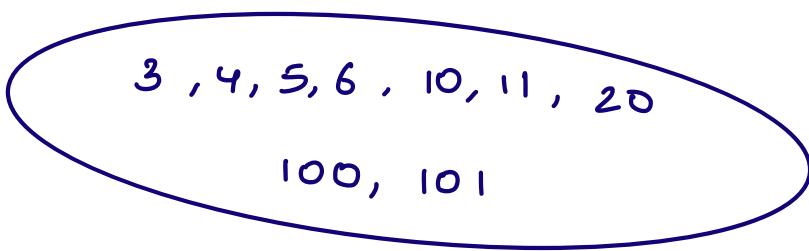

Idea 1 → sort the array

3, 4, 5, 6 → 4  
10, 11 → 2  
20 → 1  
100, 101 → 2

TC: O(n log n)

SC: O(1)

Idea 2 → HashSet

Eg: {100 4 3 6 10 20 11 5 101}

	length
100 → 101	2
4 → 5 → 6	3
3 → 4 → 5 → 6	4 → ans
6	1
10 → 11	2
20	1
11	1
5 → 6	2
101	1

Tc: O(n<sup>2</sup>)  
Sc: O(n)

x      x-1

Obs → If x-1 is present, can

x be the starting point? No

Eg:- {100 4 3 6 10 20 11 5 101}

100 → 101      length = 2

4

3 → 4 → 5 → 6      length = 4

6

10 → 11      length = 2

20

length = 1

11

5

101

$Tc: O(2n) \approx O(n)$

```
HashSet<I> set;
```

```
for( i=0; i<n; i++ ) {
```

```
    set.add(A[i]);
```

3

TC: O(n)

SC: O(n)

Iterate on hashset

```
for (i=0; i<n; i++) {
```

```
    int x = A[i];
```

```
    if (set.contains(x-1) == false)
```

```
        chain = 1
```

```
        y = x+1
```

```
        while (set.contains(y))
```

```
            chain++;
```

```
            y = y+1
```

```
        ans = max(ans, chain);
```

3

3

```
return ans;
```

arr = {6, 6, 6, 6, 7, 8, 9}

6 → 7 → 8 → 9

6 → 7 → 8 → 9

6 → 7 → 8 → 9

6 → 7 → 8 → 9

hashset = 6, 7, 8, 9

Q Given an array of Integers. Find the length of  
longest subarr with sum = 0

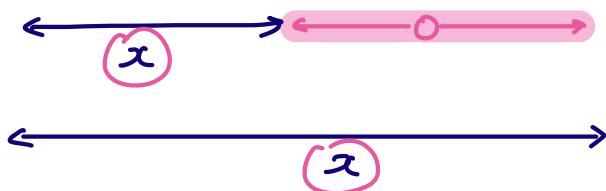

2	2	1	-3	4	3	1	-8	6	-2	1
0	1	2	3	4	5	6	7	8	9	10

 $\text{Ans} = 7$ |

$\text{arr}[] =$	<table border="1"> <tr> <td>2</td><td>2</td><td>1</td><td>-3</td><td>4</td><td>3</td><td>1</td><td>-8</td><td>6</td><td>-2</td><td>1</td> </tr> <tr> <td>0</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td> </tr> </table>	2	2	1	-3	4	3	1	-8	6	-2	1	0	1	2	3	4	5	6	7	8	9	10	$\text{Ans} = 7$
2	2	1	-3	4	3	1	-8	6	-2	1														
0	1	2	3	4	5	6	7	8	9	10														

2	4	5	2	6	9	10	2	8	6	7
0	1	2	3	4	5	6	7	8	9	10

$\text{pf}[] =$	<table border="1"> <tr> <td>2</td><td>4</td><td>5</td><td>2</td><td>6</td><td>9</td><td>10</td><td>2</td><td>8</td><td>6</td><td>7</td> </tr> <tr> <td>0</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td> </tr> </table>	2	4	5	2	6	9	10	2	8	6	7	0	1	2	3	4	5	6	7	8	9	10
2	4	5	2	6	9	10	2	8	6	7													
0	1	2	3	4	5	6	7	8	9	10													

Elements are repeating in pfsum, then  
the subarr sum b/w them is 0

O1. Insert the subarrsum in hashmap & if the  
sum appears again  $\rightarrow$  update the ans but we  
are not going to update  
its value.

2	2	1	-3	4	3	1	-8	6	-2	1
0	1	2	3	4	5	6	7	8	9	10

$\text{arr}[] =$	<table border="1"> <tr> <td>2</td><td>2</td><td>1</td><td>-3</td><td>4</td><td>3</td><td>1</td><td>-8</td><td>6</td><td>-2</td><td>1</td> </tr> <tr> <td>0</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td> </tr> </table>	2	2	1	-3	4	3	1	-8	6	-2	1	0	1	2	3	4	5	6	7	8	9	10
2	2	1	-3	4	3	1	-8	6	-2	1													
0	1	2	3	4	5	6	7	8	9	10													

2	4	5	2	6	9	10	2	8	6	7
0	1	2	3	4	5	6	7	8	9	10

 $\Rightarrow \text{Optimize}$   $\text{this to } O(1)$ |

$\text{pf}[] =$	<table border="1"> <tr> <td>2</td><td>4</td><td>5</td><td>2</td><td>6</td><td>9</td><td>10</td><td>2</td><td>8</td><td>6</td><td>7</td> </tr> <tr> <td>0</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td> </tr> </table>	2	4	5	2	6	9	10	2	8	6	7	0	1	2	3	4	5	6	7	8	9	10	$\Rightarrow \text{Optimize}$ $\text{this to } O(1)$
2	4	5	2	6	9	10	2	8	6	7														
0	1	2	3	4	5	6	7	8	9	10														

HashMap      Keys → Subarray sums

Values → index

Key      Value

ans = 0

2 → 0
